

## APPENDIX A TO PART 178—SPECIFICATIONS FOR STEEL

TABLE 1

[Open-hearth, basic oxygen, or electric steel of uniform quality. The following chemical composition limits are based on ladle analysis:]

Designation	Chemical composition, percent-ladle analysis		
	Grade 1 <sup>1</sup>	Grade 2 <sup>1,2</sup>	Grade 3 <sup>2,4,5</sup>
Carbon .....	0.10/0.20 .....	0.24 maximum .....	0.22 maximum.
Manganese .....	1.10/1.60 .....	0.50/1.00 .....	1.25 maximum.
Phosphorus, maximum .....	0.04 .....	0.04 .....	0.045. <sup>6</sup>
Sulfur, maximum .....	0.05 .....	0.05 .....	0.05.
Silicon .....	0.15/0.30 .....	0.30 maximum .....	
Copper, maximum .....	0.40 .....		
Columbium .....		0.01/0.04 .....	
Heat treatment authorized .....	( <sup>3</sup> ) .....	( <sup>3</sup> ) .....	( <sup>3</sup> ).
Maximum stress (p.s.i.) .....	35,000 .....	35,000 .....	35,000.

<sup>1</sup> Addition of other elements to obtain alloying effect is not authorized.

<sup>2</sup> Ferritic grain size 6 or finer according to ASTM E 112-96 (IBR, see § 171.7 of this subchapter).

<sup>3</sup> Any suitable heat treatment in excess of 1,100 °F., except that liquid quenching is not permitted.

<sup>4</sup> Other alloying elements may be added and shall be reported.

<sup>5</sup> For compositions with a maximum carbon content of 0.15 percent of ladle analysis, the maximum limit for manganese on ladle analysis may be 1.40 percent.

<sup>6</sup> Rephosphorized Grade 3 steels containing no more than 0.15 percent phosphorus are permitted if carbon content does not exceed 0.15 percent and manganese does not exceed 1 percent.

## CHECK ANALYSIS TOLERANCES

[A heat of steel made under any of the above grades, the ladle analysis of which is slightly out of the specified range is acceptable if the check analysis is within the following variations:]

Element	Limit or maximum specified (percent)	Tolerance (percent) over the maximum limit or under the minimum limit	
		Under minimum limit	Over maximum limit
Carbon .....	To 0.15 inclusive .....	0.02	0.03
	Over 0.15 to 0.40 inclusive .....	0.03	0.04
Manganese .....	To 0.60 inclusive .....	0.03	0.03
	Over 0.60 to 1.15 inclusive .....	0.04	0.04
	Over 1.15 to 2.50 inclusive .....	0.05	0.05
Phosphorus <sup>7</sup> .....	All ranges .....		0.01
Sulfur .....	All ranges .....		0.01
Silicon .....	To 0.30 inclusive .....	0.02	0.03
	Over 0.30 to 1.00 inclusive .....	0.05	0.05
Copper .....	To 1.00 inclusive .....	0.03	0.03
	Over 1.00 to 2.00 inclusive .....	0.05	0.05
Nickel .....	To 1.00 inclusive .....	0.03	0.03
	Over 1.00 to 2.00 inclusive .....	0.05	0.05
Chromium .....	To 0.90 inclusive .....	0.03	0.03
	Over 0.90 to 2.10 inclusive .....	0.05	0.05
Molybdenum .....	To 0.20 inclusive .....	0.01	0.01
	Over 0.20 to 0.40 inclusive .....	0.02	0.02
Zirconium .....	All ranges .....	0.01	0.05
Columbium .....	To 0.04 inclusive .....	0.005	0.01
Aluminum .....	Over 0.10 to 0.20 inclusive .....	0.04	0.04
	Over 0.20 to 0.30 inclusive .....	0.05	0.05

<sup>7</sup> Rephosphorized steels not subject to check analysis for phosphorus.

[Amdt. 178-3, 34 FR 12283, July 25, 1969; 34 FR 12593, Aug. 1, 1969, as amended by Amdt. 178-64, 45 FR 81573, Dec. 11, 1980; Amdt. 178-97, 55 FR 52728, Dec. 21, 1990; 68 FR 75758, Dec. 31, 2003]

## APPENDIX B TO PART 178—ALTERNATIVE LEAKPROOFNESS TEST METHODS

In addition to the method prescribed in § 178.604 of this subchapter, the following leakproofness test methods are authorized:

(1) *Helium test.* The packaging must be filled with at least 1 L inert helium gas, air tight closed, and placed in a testing chamber. The testing chamber must be evacuated down to a pressure of 5 kPa which equals an over-pressure inside the packaging of 95 kPa.

Pt. 178, App. C

49 CFR Ch. I (10–1–11 Edition)

The air in the testing chamber must be analyzed for traces of helium gas by means of a mass spectrograph. The test must be conducted for a period of time sufficient to evacuate the chamber and to determine if there is leakage into or out of the packaging. If helium gas is detected, the leaking packaging must be automatically separated from non-leaking drums and the leaking area determined according to the method prescribed in §178.604(d) of this subchapter. A packaging passes the test if there is no leakage of helium.

(2) *Pressure differential test.* The packaging shall be restrained while either pressure or a vacuum is applied internally. The packaging must be pressurized to the pressure required by §178.604(e) of this subchapter for the appropriate packing group. The method of restraint must not affect the results of the test. The test must be conducted for a period of time sufficient to appropriately pressurize or evacuate the interior of the packaging and to determine if there is leakage into or out of the packaging. A packaging passes the pressure differential test if there is no change in measured internal pressure.

(3) *Solution over seams.* The packaging must be restrained while an internal air pressure is applied; the method of restraint may not affect the results of the test. The exterior surface of all seams and welds must be coated with a solution of soap suds or a water and oil mixture. The test must be conducted for a period of time sufficient to pressurize the interior of the packaging to the specified air pressure and to determine if there is leakage of air from the packaging. A packaging passes the test if there is no leakage of air from the packaging.

(4) *Solution over partial seams test.* For other than design qualification testing, the following test may be used for metal drums: The packaging must be restrained while an internal air pressure of 48 kPa (7.0 psig) is applied; the method of restraint may not affect the results of the test. The packaging must be coated with a soap solution over the entire side seam and a distance of not less than eight inches on each side of the side seam along the chime seam(s). The test must be conducted for a period of time sufficient to pressurize the interior of the packaging to the specified air pressure and to determine if there is leakage of air from the packaging. A packaging passes the test if there is no leakage of air from the packaging. Chime cuts must be made on the initial drum at the beginning of each production run and on the initial drum after any adjustment to the chime seamer. Chime cuts must be maintained on file in date order for not less than six months and be made available to a rep-

resentative of the Department of Transportation on request.

[Amdt. 178–97, 55 FR 52728, Dec. 21, 1990, as amended at 56 FR 66287, Dec. 20, 1991; 57 FR 45466, Oct. 1, 1992]

APPENDIX C TO PART 178—NOMINAL AND MINIMUM THICKNESSES OF STEEL DRUMS AND JERRICANS

For each listed packaging capacity, the following table compares the ISO 3574 (IBR, see §171.7 of this subchapter) nominal thickness with the corresponding ISO 3574 minimum thickness.

Maximum capacity (L)	ISO nominal (mm)	Corresponding ISO minimum (mm)
20 .....	0.7	0.63
30 .....	0.8	0.73
40 .....	0.8	0.73
60 .....	1.0	0.92
120 .....	1.0	0.92
220 .....	1.0	0.92
450 .....	1.9	1.77

[Amdt. 178–106, 59 FR 67522, Dec. 29, 1994, as amended at 68 FR 75758, Dec. 31, 2003]

APPENDIX D TO PART 178—THERMAL RESISTANCE TEST

1. *Scope.* This test method evaluates the thermal resistance capabilities of a compressed oxygen generator and the outer packaging for a cylinder of compressed oxygen or other oxidizing gas and an oxygen generator. When exposed to a temperature of 205 °C (400 °F) for a period of not less than three hours, the outer surface of the cylinder may not exceed a temperature of 93 °C (199 °F) and the oxygen generator must not actuate.

2. *Apparatus.*

2.1 *Test Oven.* The oven must be large enough in size to fully house the test outer package without clearance problems. The test oven must be capable of maintaining a minimum steady state temperature of 205 °C (400 °F).

2.2 *Thermocouples.* At least three thermocouples must be used to monitor the temperature inside the oven and an additional three thermocouples must be used to monitor the temperature of the cylinder. The thermocouples must be 1/16 inch, ceramic packed, metal sheathed, type K (Chromel-Alumel), grounded junction with a nominal 30 American wire gauge (AWG) size conductor. The thermocouples measuring the temperature inside the oven must be placed at varying heights to ensure even temperature and proper heat-soak conditions. For
